

Product Roadmap

Version: 1.0

Purpose

This roadmap defines the product evolution of Trading Platform Pro.

The primary product is the Trading Cockpit.

Development shall follow concrete trading workflows and measurable user value rather than building platform capabilities without an identified product requirement.

Product Direction

Trading Platform Pro shall evolve into a professional desktop Trading Cockpit for active traders.

The product roadmap follows three principles:

1. Build the Trading Cockpit as early as practical.
2. Develop platform services when required by concrete product workflows.
3. Deliver usable product increments throughout development.

The Trading Cockpit is not a late-stage application built after completing the entire platform. It is the primary product that drives platform evolution.

Phase 1 – Product and Engineering Foundation

Status: ****In Progress****

Objective:

Establish the minimum product, architecture and engineering foundation required for controlled Trading Cockpit development.

Major capabilities:

- Repository structure
- Documentation framework
- Product Vision
- Product Roadmap
- Clean Architecture
- Domain-Driven Design
- Dependency Injection
- Configuration foundation
- Logging foundation
- Runtime foundation
- Testing infrastructure
- CI/CD
- Developer workflow
- Documentation generation

Exit criteria:

- product direction documented
- architecture boundaries documented
- development workflow operational
- automated quality checks operational
- documentation maintained as Markdown source
- generated documentation reproducible

Phase 2 – Trading Cockpit Shell

Objective:

Deliver the first executable Trading Cockpit application.

Major capabilities:

- Desktop application startup
- Main application window
- Workspace shell
- Dockable widget areas
- Navigation
- Status bar
- Notification area
- Command Palette foundation
- Theme foundation
- Workspace state persistence

Initial widgets:

- Market Overview placeholder
- Watchlist placeholder
- Portfolio Overview placeholder
- Risk Overview placeholder

Product outcome:

The user can start the Trading Cockpit, arrange the workspace and restore the previous working context.

Exit criteria:

- application starts and shuts down deterministically
- workspace can be configured
- widgets can be docked and resized
- workspace state can be restored
- runtime status is visible
- UI remains responsive

Phase 3 – Market Observation Workflow

Objective:

Enable the user to observe markets and maintain relevant trading instruments.

Major capabilities:

- Market Data foundation
- Instrument model
- Symbol resolution
- Market Overview
- Watchlists
- Quote updates
- Market status
- Basic chart integration
- Data freshness visibility

Trading workflow:

1. Open Trading Cockpit.
2. Restore workspace.
3. Observe current market state.
4. Review watchlists.
5. Select an instrument.
6. Inspect price and market information.

Product outcome:

The user can monitor relevant instruments without switching to separate market observation tools.

Exit criteria:

- instruments can be identified consistently
- watchlists can be created and maintained
- market data state is visible
- stale data is identifiable
- selected instruments can be shared between widgets

Phase 4 – Trading Candidate Workflow

Objective:

Enable the user to identify and evaluate potential trading opportunities.

Major capabilities:

- Market Scanner
- Scanner result lists
- Filtering
- Sorting
- Instrument selection
- Chart context
- Watchlist integration
- Trading candidate state
- Decision Center foundation

Trading workflow:

1. Observe the market.
2. Run or review a scanner.
3. Filter trading candidates.
4. Select an instrument.
5. Review chart and market context.
6. Add the instrument to a watchlist or Decision Center.

Product outcome:

The user can move from broad market observation to a defined set of trading candidates within the Trading Cockpit.

Exit criteria:

- scanner results are reproducible
- filtering and sorting are deterministic
- instrument context is preserved between widgets
- trading candidates can be tracked
- candidate state can be restored

Phase 5 – Portfolio and Risk Context

Objective:

Provide portfolio and risk information during the trading decision process.

Major capabilities:

- Broker Integration foundation
- Portfolio model
- Position Management
- Portfolio Overview
- Position Overview
- P&L; visibility
- Exposure visibility
- Risk Overview
- Data reconciliation
- Broker connection state

Trading workflow:

1. Select a trading candidate.
2. Review current portfolio.
3. Review existing positions.
4. Evaluate exposure.
5. Review available risk information.
6. Continue or reject the trading opportunity.

Product outcome:

Trading decisions can be evaluated within current portfolio and risk context.

Exit criteria:

- broker state is visible
- portfolio state is reproducible
- positions are represented consistently
- portfolio and broker discrepancies are identifiable
- risk information is visible before order preparation

Phase 6 – Order and Position Workflow

Objective:

Support controlled order preparation, execution and position monitoring.

Major capabilities:

- Order domain
- Order Management
- Order Entry widget
- Order validation
- Broker order submission
- Open Orders
- Order lifecycle visibility
- Execution feedback
- Position updates
- Error and rejection handling

Trading workflow:

1. Evaluate a trading opportunity.
2. Prepare an order.
3. Validate the order.
4. Review order parameters.
5. Submit the order.
6. Monitor order state.
7. Confirm execution state.
8. Monitor the resulting position.

Product outcome:

The user can complete the core trading workflow without leaving the Trading Cockpit.

Exit criteria:

- orders are validated before submission
- order state transitions are transparent
- broker rejections are visible
- duplicate submissions are controlled
- execution state is reconciled
- resulting positions are visible

Phase 7 – Integrated Decision Center

Objective:

Consolidate trading candidates, context and decision information.

Major capabilities:

- Decision Center
- Trading candidate lifecycle
- Notes
- Tags
- Signals
- Strategy evaluation
- Portfolio context
- Risk context
- Decision status
- Historical decision information

Trading workflow:

1. Identify a candidate.
2. Collect relevant context.
3. Evaluate market information.
4. Evaluate portfolio and risk context.
5. Record the trading decision.
6. Prepare an order or reject the candidate.
7. Review the decision later.

Product outcome:

The Trading Cockpit supports a transparent and reviewable trading decision process.

Exit criteria:

- candidate lifecycle is defined
- decision state is persistent
- relevant context is linked
- decisions are reviewable
- order preparation can originate from an accepted decision

Phase 8 – Trading Review and Analytics

Objective:

Enable users to review trading outcomes and improve their workflows.

Major capabilities:

- Trading Journal
- Trade history
- Decision history
- Performance Analysis
- Risk Analytics
- Statistics
- Reporting
- Equity Curve
- Workflow review

Trading workflow:

1. Review completed trades.
2. Compare decisions with outcomes.
3. Analyze performance.
4. Identify recurring patterns.
5. Improve trading workflows.

Product outcome:

Trading activity becomes measurable and reviewable within the platform.

Exit criteria:

- completed trading workflows can be reconstructed
- decisions and trades can be correlated
- performance information is reproducible
- reports can be generated
- historical information remains traceable

Phase 9 – Strategy and Automation Capabilities

Objective:

Extend the Trading Cockpit with systematic and semi-automated workflows.

Major capabilities:

- Strategy Engine
- Signal Processing
- Backtesting
- Paper Trading
- Strategy Evaluation
- Controlled Automation

- Optimization

Automation shall remain transparent and observable.

Autonomous trading is not introduced implicitly.

Product outcome:

Systematic workflows can reuse the same market, portfolio, risk and execution capabilities as manual trading workflows.

Phase 10 – Platform Ecosystem

Objective:

Extend the established Trading Cockpit platform.

Potential capabilities:

- Plugin SDK
- Public APIs
- Scripting
- Import and Export
- Additional broker integrations
- Advanced Analytics
- AI-assisted Decision Support
- Cloud readiness

These capabilities shall only be introduced when justified by concrete product requirements.

Continuous Product Activities

The following activities continue throughout every phase:

- Product validation
- Architecture review
- Refactoring
- Documentation
- Testing
- Performance improvement
- Security improvement
- Observability improvement
- CI/CD improvement
- Technical debt reduction

Prioritization Principles

Product capabilities shall be prioritized by:

1. Trading workflow value
2. User value
3. Risk reduction
4. Technical dependency
5. Architectural impact
6. Maintainability

Avoid implementing platform capabilities without a defined product use case.

Avoid implementing isolated widgets without a defined trading workflow.

Increment Strategy

Each phase should deliver a usable and testable product increment.

Development should prefer vertical product slices.

Example:

Market Data → Watchlist → Instrument Selection → Chart Context

is preferred over independently completing every possible Market Data infrastructure capability before exposing product functionality.
Platform services shall evolve together with product workflows.

Release Strategy

Each roadmap phase should conclude with:

- product review
- architecture review
- documentation review
- testing completion
- operational readiness assessment
- release readiness assessment

Major product increments should provide a stable foundation for the next workflow.

Success Indicators

The roadmap is successful when:

- the Trading Cockpit provides usable product increments
- core trading workflows become progressively integrated
- unnecessary tool switching is reduced
- user context is preserved across widgets
- application behaviour remains deterministic
- architecture remains maintainable
- documentation stays synchronized
- automated quality assurance remains operational

Roadmap Governance

The Product Roadmap is a living product document.

Review it:

- after each product phase
- after significant user workflow findings
- after major architectural decisions
- when product priorities change

Major roadmap changes shall be documented in the Decision Log where appropriate.

Roadmap Review Checklist

Before starting a new product phase verify:

- previous exit criteria reviewed
- target user workflow defined
- expected product outcome documented
- technical dependencies identified
- architecture impact evaluated
- documentation synchronized
- quality goals defined
- implementation priority confirmed
