

Project Structure

Version: 1.0

Purpose

This document describes the physical structure of the Trading Platform Pro repository. A consistent project structure improves maintainability, discoverability and scalability.

Repository Layout

project/

■

■■■ docs/

■■■ src/

■■■ tests/

■■■ config/

■■■ scripts/

■■■ tools/

■■■ .github/

■■■ pyproject.toml

■■■ requirements.txt

■■■ requirements-dev.txt

■■■ README.md

■■■ AGENTS.md

Source Code

All production code resides in:

src/

The source code is organized by architectural responsibility rather than technical framework.

Example:

src/

■■■ trading_platform/

■■■ application/

■■■ domain/

■■■ infrastructure/

■■■ presentation/

■■■ shared/

Documentation

All documentation is located in:

docs/

Structure:

architecture/

product/
developer/
operations/
adr/
api/
ui/
user/
specifications/
decisions/
...

Each directory has a single responsibility.

Tests

Automated tests reside in:

...

tests/
...

Typical structure:

...

tests/
■■■ unit/
■■■ integration/
■■■ system/
■■■ performance/
...

Tests mirror the production structure where practical.

Configuration

Configuration files reside in:

...

config/
...

Configuration is externalized and environment-specific.

Examples:

- development
- testing
- production

Scripts

Reusable automation scripts are stored in:

...

scripts/
...

Examples:

- build
- maintenance
- release
- utilities

GitHub

Repository automation resides in:

.github/

Including:

- CI/CD
- Workflows
- Templates

Naming Conventions

Directories:

- lowercase
- singular where appropriate
- descriptive names

Python files:

- snake_case

Classes:

- PascalCase

Functions:

- snake_case

Constants:

- UPPER_CASE

Design Principles

The repository structure shall:

- remain simple
- be easy to navigate
- scale with project growth
- reflect the architecture
- minimize unnecessary nesting

Evolution Rules

When introducing new modules:

- preserve architectural boundaries
- keep related functionality together
- avoid duplication
- document structural changes

Repository Organization Rules

The repository shall follow these principles:

- one responsibility per directory
- clear separation of source code and documentation
- consistent naming conventions
- minimal directory depth
- avoid duplicated structures

Documentation Structure

Documentation shall be organized by domain:

- product
- architecture
- specifications

- api
- ui
- operations
- developer
- user
- decisions

Each document shall have a single authoritative location.

Repository Growth

As the project evolves:

- extend existing structures before creating new ones
- preserve architectural consistency
- avoid parallel implementations
- review the overall structure regularly

Structure Review Checklist

Before introducing new folders verify:

- existing location cannot be reused
- architecture remains consistent
- naming follows conventions
- documentation is updated
- no duplicate responsibility is introduced
