

Software Architecture

Version: 1.0

Purpose

This document defines the software architecture of Trading Platform Pro and its primary application, the Trading Cockpit.

The architecture shall support incremental development of concrete trading workflows while preserving maintainability, deterministic behaviour and explicit system boundaries.

Architecture exists to support product development.

The platform shall not be generalized prematurely for hypothetical future applications.

Architectural Goals

The architecture is designed to achieve:

- Long-term maintainability
- Deterministic behaviour
- Strong separation of concerns
- Explicit dependencies
- High testability
- Operational transparency
- Incremental product delivery
- Controlled extensibility
- Professional software quality

Product-Driven Architecture

The Trading Cockpit is the primary application.

Architecture capabilities shall evolve from concrete product workflows such as:

- market observation
- instrument selection
- trading candidate evaluation
- portfolio context
- risk context
- order execution
- position monitoring
- trading review

Technical capabilities shall not be introduced without a defined architectural or product requirement.

Architectural Style

Trading Platform Pro follows:

- Clean Architecture
- Domain-Driven Design
- Modular Monolith
- Event-Driven Architecture
- Dependency Injection
- Explicit Dependencies

The Modular Monolith is the default deployment architecture.

Distribution into independent services requires explicit architectural justification.
